

The population before and after the campaign

One run at the operating point, $N = 300$, laid out by the network; colour is the moral position b_i
 $t = 0$, before the campaign

$t = 150$, at withdrawal

25% of the population has been carried to the entrepreneur's pole and the remainder have not moved.
The resulting gap is twice the tolerance $\varepsilon = 0.5$, so the two groups no longer influence each other's positions and each contributes to the other's alarm.
