

One run at the operating point,  $N = 300$ , laid out by the network; colour is the moral position  $b_i$

$t = 0$ , before the campaign

$t = 150$ , at withdrawal

25% of the population has been carried to the entrepreneur's pole and the remainder have not moved.  
The resulting gap is twice the tolerance  $\varepsilon = 0.5$ , so the two groups no longer influence each other's positions and each contributes to the other's alarm.
